

Restoring 4 cyprinid spawning areas in the Mehaigne watershed (Be)

SAR Consult design and manage the construction works for the restoration of 4 major cyprinid spawning areas in the Mehaigne Valley (European FEP project).

The high level of sediments in the river was an important part of the issue: how to maintain good spawning ground quality for the phytophiles fish like cyprinids and pike. Using deflectors and specific wetlands shapes, we have enhanced the habitat also for fry and fish juveniles.

The project has been broadcast by the local television <http://www.rtc.be/reportages/262-general/1467280-contrat-de-riviere-meuse-aval-4-frayeres-reamenagees>
